# **Sponsor Roles (SR)**

Github Sponsors does not have a way to natively apply Discord roles to sponsors like Patreon does, that's what this service does

Proposed by Carter Himmel

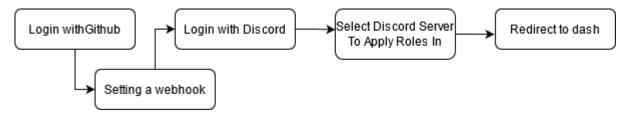

# **Terminology**

creator - the person being sponsored

sponsor - the person sponsoring the creator

# How?

## **Onboarding**

#### **Login with Github**

Using the Github OAuth2 Flow (scopes read:user & user:email), creators will essentially link their Github account to their Sponsor Roles account. This is also one of two ways creators can log into the dashboard at a later date.

#### Setting a webhook

After ensuring the user is who they say they are, we'll provide the user with a payload URL and secret and also make sure they know to keep Content-Type set to <a href="mailto:application/x-www-form-urlencoded">application/x-www-form-urlencoded</a>. Only after receiveing the <a href="mailto:ping">ping</a> event from the webhook will we continue with the next step.

#### **Login with Discord**

Using the Discord OAuth2 Flow (scopes email and guilds), creators will essentially linktheir Discord account to their Sponsor Roles account. This allows us to ensure they are

who they say they are and allow us to fetch the guilds they have MANAGE\_GUILD and MANAGE\_ROLES in.

#### **Select Discord server to Apply Roles In**

In this step, the user will be able to select which server they'd like to apply roles to their sponsors in. Once clicking the server, they'll be redirected to Discord to add the bot to their server. After adding the bot to their server, they'll be redirected to the dashboard where they can specify which roles they'd like to apply to specific sponsor tiers. This is also one of two ways creators can log into the dashboard at a later date.

# How to know which Discord user to apply roles to

In the sponsorship event payload, the sponsor's user object is sent.

One way to ensure the user is who they say they are is:

- 1. Authorization similar to Keybase -- creating a gist with data on the sponsor to prove who they are <a href="example">example</a>
- 2. Require sponsors to log into the dashboard and link their Github and Discord

When we recieve that event from Github, we can crossreference to what we have stored in our database and apply those roles to the user.

# Handling new sponsors and tier changes

With the webhook we setup in the onboarding process, well recieve the **sponsorship** event.

If a new sponsorship is created, the action field of that payload will be equal to created. On this event, we'll apply the roles if the user is in the server.

If the user changes their sponsorship tier, the action field of that payload will be equal to tier\_changed. On this event, we'll remove roles associeted with the old tier and add roles with the new tier.

We must also listen on the GUILD\_MEMBER\_ADD event from Discord to apply roles to a user upon joining the server.

# **Syncing**

### **Sponsorship Tier Changes**

Sponsors will likely want to create, delete or edit sponsorship tiers later down the road. To handle this, we need a cronjob to fetch sponsorship tiers every n minutes and ensure any tiers they've set roles for still exist.

#### **Discord Roles**

#### Roles being deleted

The creator or and admin of the server may delete roles. To handle this, we need a cronjob to fetch guild roles every minutes and ensure they haven't deleted any configured roles. If they have, we'll remove that role from the configuration for that tier.

#### Role application falling out of sync

It's possible that we miss things. To handle this, we need a cronjob to fetch the current sponsors of the creator every minutes and ensure they have their Discord roles.

#### **Premium Tier**

For a monthly fee, creators can:

- · Specify more than one server to apply roles in
- Apply roles on more than n sponsorship tiers

# **Possible Domains**

sponsorroles.com <u>namecheap</u> sponsorrol.es <u>namecheap</u>

#### **Short Domains**

```
spnsrrol.es <u>namecheap</u>
spnrsrl.es <u>namecheap</u>
spnsrrl.es <u>namecheap</u>
```

### **Notable Queries**

#### Fetch a creators sponsors

```
{
viewer {
id
databaseId
email
```

```
login
sponsorshipsAsSponsor(first: 100) {
  nodes {
    id
    tier {
      id
    sponsorEntity {
      ... on User {
        id
        databaseId
        login
createdAt
updatedAt
```

## Fetch a creator's tiers

```
viewer {
  id
  email
  login
  sponsorsListing {
    id
    tiers(first: 50) {
     nodes {
       id
       monthlyPriceInCents
       name
       createdAt
       updatedAt
    }
}
```

```
}
createdAt
updatedAt
}
```
